1. Purpose and Scope

Define the system boundary, intended users, supported business processes, and exclusions.

2. Architecture Overview

Describe the logical architecture, deployment model, external systems, and principal technology decisions.

3. Functional Requirements

Assign unique identifiers and measurable acceptance conditions to every functional requirement.

4. Nonfunctional Requirements

Specify performance, availability, scalability, accessibility, maintainability, and observability targets.

5. Data and Integration

Define entities, ownership, retention, synchronization, APIs, event flows, and migration requirements.

6. Identity, Security, and Privacy

Define authentication, authorization, secrets, encryption, audit logging, privacy, and incident controls.

7. Environments and Deployment

Define development, test, staging, production, release, rollback, and infrastructure-as-code requirements.

8. Verification and Acceptance

Define automated tests, manual validation, security checks, performance validation, and release gates.

9. Operations and Support

Define monitoring, alerting, backup, recovery, runbooks, support ownership, and service levels.
